

Declaration of Product Data Privacy

To whom it may concern,

Data Privacy is a major focus area for Xovis and a reason why our Founders set up the company in 2008.

Since General Data Protection Regulation (GDPR) went into effect we ensured that all our products are compliant with the new framework. In fact, this was primarily paperwork instead of adapting the product. We looked out for a certification which confirms the fact that we are compliant. As there is no governmental body who certifies a product according to GDPR we must rely on private initiatives. We selected a German institute because of Germany's track record of setting a strong focus on data privacy. We submitted our products for the renowned ePrivacy Seal. The certificate is available on our website. As part of the process, a detailed legal assessment has been done. Due to the detailed nature how our products have been scrutinized, we are not able to share the expert report itself.

Two points that we would like to highlight regarding data privacy and GDPR on our sensors:

Our approach is based on two image sensors which capture an image of the scenery from an overhead point of view. The images are processed internally on the sensor in a closed hardware environment. On this level an abstract 3D image is generated to track a person as well a Deep Neuronal Network (DNN) analyzes the images and classifies an object based on a trained configuration. After this processing, no image is needed nor further processed and only the configured data points are transferred to the internal system for statistical reasons. No image will be stored during this process. Everything is processed in real time. Based on the fact that attributes (such as gender, view direction, mask detection and any future attribute we may add) cannot be matched back to an individually person, we fully comply with GDPR.

For Wifi based analytics we ensure data privacy by hashing an individual MAC Address with a customized key which makes it impossible to identify a specific person or the according device in a later stage. Only hashed addresses leave the device.

For more information on the ePrivacy Seal please check: <https://www.eprivacy.eu/en/privacy-seals/eprivacyseal/>
